

- **/gen** → Generate code snippet based on description.

Example: /gen function to validate email in TypeScript

- **/fix** → Suggest a fix for the highlighted error or bug.

Example: /fix resolve ECONNREFUSED error in MongoDB connection

- **/doc** → Auto-generate documentation or comments.

Example: /doc explain this function in JSDoc format

- **/test** → Create unit tests for the selected function/module.

Example: /test add Jest tests for login API

- **/refactor** → Improve readability, performance, or structure of code.

Example: /refactor simplify nested if-else in userAuth.ts

- **/explain** → Explain what the selected code does.

Example: /explain src/toolintegration.ts

- **/config** → Generate or update configuration files.

Example: /config create tsconfig.json for React project

- **/api** → Scaffold API endpoints.

Example: /api generate CRUD endpoints for products

- **/db** → Generate database schema or queries.

Example: /db create MongoDB schema for users collection

- **/deploy** → Provide deployment scripts or instructions.

Example: /deploy Dockerfile for Node.js app

- **/env** → Suggest environment variable setup.

Example: /env add variables for MongoDB Atlas connection

- **/review** → Perform code review and highlight issues.

Example: /review check for security vulnerabilities
